Features of the Cross-Roller Ring

Fig.1 Structure of Cross Roller-Ring Model RB

Structure and Features

With the Cross-Roller Ring, cylindrical rollers are arranged with each roller perpendicular to the adjacent roller, in a 90° V groove, separated from each other by a spacer retainer. This design allows just one bearing to receive loads in all directions including radial, axial and moment loads.

Since the Cross-Roller Ring achieves high rigidity despite the minimum possible dimensions of the inner and outer rings, it is optimal for applications such as joints and swiveling units of industrial robots, swiveling tables of machining centers, rotary units of manipulators, precision rotary tables, medical equipment, measuring instruments and IC manufacturing machines.

[High Rotation Accuracy]

The spacer retainer fitting among cross-arrayed rollers prevents rollers from skewing and the rotational torque from increasing due to friction between rollers. Unlike conventional types using steel sheet retainers, the Cross-Roller Ring does not cause unilateral contact of roller or seize. Thus, even under a preload, the Cross-Roller Ring provides stable rotation.

Since the inner and outer rings are designed to be separable, the preload can be adjusted, and this feature enables accurate rotation.

[Easy Handling]

The inner and outer rings, which are separable, are secured to the Cross-Roller Ring body after being installed with rollers and spacer retainers in order to prevent the rings from separating from each other. Thus, it is easy to handle the rings when installing the Cross-Roller Ring.

[Skewing Prevention]

The spacer retainer keeps rollers in their proper position, thereby preventing them from skewing (tilted rollers). This eliminates friction between rollers, and therefore secures a stable rotational torque.

[Increased Rigidity (Three to Four Times Greater than the Conventional Type)]

Unlike the thin angular ball bearings installed in double rows, the cross array of rollers allows a single cross-roller ring unit to receive loads in all directions, increasing the rigidity to three to four times greater than the conventional type.

Moment Rigidity Diagram

Angular ball bearing

Model RA5008

Model RB5013

Cross Roller Ring

[Large Load Capacity]

(1) Compared with conventional steel sheet retainers, the spacer retainer allows a longer effective contact length of each roller, thus significantly increasing the load capacity.

The spacer retainer guides rollers by supporting them over the entire length of each roller, whereas the conventional type of retainer supports them only at a point at the center of each roller. Such one-point contact cannot sufficiently prevent skewing.

Roller contact length

With a spacer retainer

$$l_1 > l_2$$

With a steel sheet retainer (conventional type)

(2) In conventional types, the loaded areas are asymmetrical between the outer ring and the inner ring sides around the roller longitudinal axis. The greater the applied load is, the greater the moment becomes, leading end-face contact to occur. This causes frictional resistance, which hinders smooth rotation and quickens wear.

Loaded areas symmetrical
With a spacer retainer

Loaded areas asymmetrical
With a steel sheet retainer (conventional type)

Types of the Cross-Roller Ring

Types and Features

Model RU (Integrated Inner/Outer Ring Type)

Specification Table⇒A18-22

The integrated design of the unit's inner and outer rings, with mounting holes on both rings, eliminates the need for a special flange or housing and enables easy installation. Mounting has virtually no effect on performance, which ensures stable, accurate rotation and torque. Can be used for both outer and inner ring rotation.

Model RU

Model RB (Separable Outer Ring Type for Inner Ring Rotation)

Specification Table⇒A18-24

Cross-Roller Ring basic type, with a separable outer ring, and an inner ring integrated with the main body. It is used in locations where the rotational accuracy of the inner ring is required. It is used, for example, in the swivel portions of index tables of machine tools.

Model RB

Model RE (Two-piece Inner Ring Type for Outer Ring Rotation)

Specification Table⇒A18-27

Main dimensions are the same as model RB. This model is used in locations where the rotational accuracy of the outer ring is required.

Model RE

USP-Grade Series of Models RB and RE

Specification Table⇒ **A18-30**

The rotation accuracy of the USP-Grade Series achieves the ultra precision grade that surpasses the world's highest accuracy standards such as JIS Class 2, ISO Class 2, DIN P2 and AFBMA ABCE9.

Model RAU (Integrated Inner/Outer Ring Type)

Specification Table⇒ **A18-31**

The extremely small cross-sectional area allows it to be used in lightweight, compact devices. The integrated inner/outer ring structure can be used for both inner and outer ring rotation. There is a 5 mm thin type and an RA interchangeable type. The thin type product lineup starts at a micro-sized 10 mm inner diameter.

Model RAU

Model RA (Separable Outer Ring Type for Inner Ring Rotation)

Specification Table⇒ **A18-33**

A compact type similar to model RB with the thinnest possible inner and outer rings. It enables lightweight and compact designs for the swiveling hand portions of manipulators and robots.

Model RA

Model RA-C (Single-Split Type)

Specification Table⇒ **A18-34**

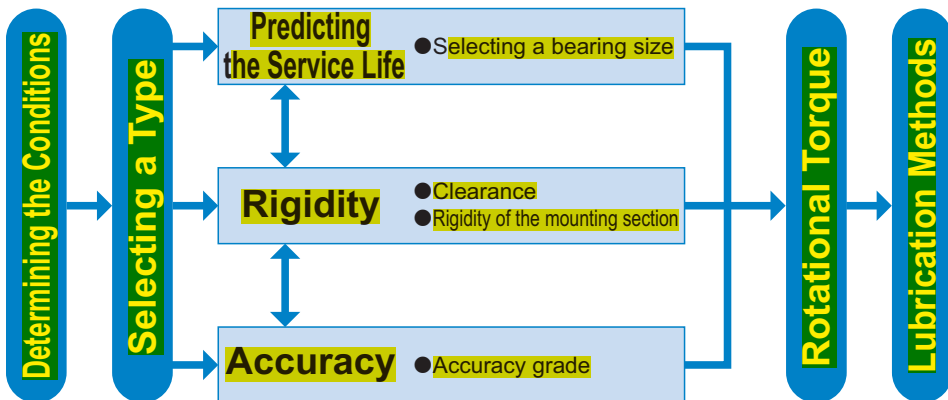

The main dimensions are the same as that of model RA. Owing to its Single-split Outer Ring structure with a highly rigid outer ring, this model can be used for outer ring rotation.

Model RA-C

Selecting a Cross-Roller Ring

The following diagram shows a typical procedure for selecting a Cross-Roller Ring.

- Inner ring rotating.....Model RB
- Outer ring rotating.....Model RE
- Mounting space.....Models RAU, RA, and RA-C
- Mounting holes.....Model RU

Nominal Life

[Calculating the Nominal Life]

The nominal life (L_{10}) is obtained from the following formula using the basic dynamic load rating (C) and the load applied to the cross-roller ring (P_c).

$$L_{10} = \left(\frac{C}{P_c}\right)^{\frac{10}{3}} \times 10^6 \dots\dots\dots (1)$$

- L_{10} : Nominal life (rev.)
- C : Basic dynamic load rating* (N)
- P_c : Dynamic equivalent radial load (N)

[Calculating the Modified Nominal Life]

During use, a cross-roller ring may be subjected to vibrations and shocks as well as fluctuating loads, which are difficult to detect. In addition, the operating temperature will have a decisive impact on the service life. Taking these factors into account, the modified nominal life (L_{10m}) can be calculated according to the following formula (2).

•Modified factor α

$$\alpha = \frac{f_T}{f_w}$$

- α : Modified factor
- f_T : Temperature factor (see Fig.1)
- f_w : Load factor (see Table1)

•Modified nominal life L_{10m}

$$L_{10m} = \left(\alpha \times \frac{C}{P_c}\right)^{\frac{10}{3}} \times 10^6 \dots\dots\dots (2)$$

- L_{10m} : Modified nominal life (rev.)
- C : Basic dynamic load rating* (N)
- P_c : Dynamic equivalent radial load (N)

* The basic dynamic load rating (C) of the cross roller ring shows the radial load under which the nominal life is 1 million revolutions when a group of identical cross roller ring units independently operate, assuming a constant direction and magnitude of the load. Basic dynamic load ratings (C) are indicated in the specification tables.

* Rated life is calculated according to load and presumes optimal mounting conditions and adequate lubrication. Usage involving back-and-forth motion or low-speed operation may affect lubrication requirements. Please consult THK for assistance in calculating service life for usage involving back-and-forth motion or low-speed operation.

Fig.1 Temperature Factor (f_T)

Note) The normal service temperature is 80°C or below. If the product is to be used at a higher temperature, contact THK.

[f_w Load Factor]

Machines that perform rotary movements are often subjected to vibration and impact during operation. It is difficult to accurately identify the cause of vibration from a motor, gears, or other drive components, or of impact arising from frequent starts and stops.

In the event of excessive vibration or impact, divide the basic dynamic load rating (C) by the corresponding load factor, using the empirically obtained figures in Table 1 as guidelines.

Table1 Load Factor (f_w)

Service condition	f_w
Smooth motion without impact	1 to 1.2
Normal motion	1.2 to 1.5
Excessive vibration or impact	1.5 to 3

[Calculating the Service Life Time]

● For Rotary Motion

$$L_h = \frac{L_{10}}{N \times 60}$$

L_h : Service life time (h)
 N : Rotation speed per minute* (min⁻¹)

* If rotated continuously, significant heat may be generated depending on the rotation speed. Consult with THK about the rotation speed.

● For Oscillatory Motion

$$L_h = \frac{360 \times L_{10}}{2 \times \theta \times n_o \times 60}$$

L_h : Service life time (h)
 θ : Rocking angle (deg.)
(* see figure at right)
 n_o : Number of reciprocations per minute (min⁻¹)

* Rocking angle: If θ is too small, this will hinder the formation of an oil film on the contact surfaces between the race and the roller and may cause fretting. If the product will be used in these conditions, contact THK.

[Dynamic Equivalent Radial Load P_c]

The dynamic equivalent radial load of the Cross-Roller Ring is obtained from the following equation.

$$P_c = X \cdot \left(F_r + \frac{2M}{dp} \right) + Y \cdot F_a$$

P_c : Dynamic equivalent radial load (N)
 F_r : Radial load (N)
 F_a : Axial load (N)
 M : Moment (N·mm)
 X : Dynamic radial factor (see Table2)
 Y : Dynamic axial factor (see Table2)
 dp : Roller pitch circle diameter (mm)

Table2 Dynamic Radial Factor and Dynamic Axial Factor

Classification	X	Y
$\frac{F_a}{F_r + 2M/dp} \leq 1.5$	1	0.45
$\frac{F_a}{F_r + 2M/dp} > 1.5$	0.67	0.67

- If $F_r = 0N$ and $M = 0 N\cdot mm$, perform calculation while assuming that $X = 0.67$ and $Y = 0.67$.
- For service life calculation with a preload taken into account, contact THK.

Static Safety Factor

The basic static load rating C_0 refers to the static load with constant direction and magnitude, under which the calculated contact stress in the center of the contact area between the roller and the raceway under the maximum load is 4000 MPa. (If the contact stress exceeds this level, it will affect the rotation.) This value is indicated as “ C_0 ” in the specification tables. When a load is statically or dynamically applied, it is necessary to consider the static safety factor as shown below.

$$\frac{C_0}{P_0} = f_s$$

- f_s : Static safety factor (see Table3)
 C_0 : Basic static load rating (N)
 P_0 : Static equivalent radial load (N)

Table3 Static Safety Factor (f_s)

Load conditions	Lower limit of f_s
Normal load	1 to 2
Impact load	2 to 3

* Target minimum values for the static safety factor are shown in the table above. For better service life and other aspects of dynamic performance, THK recommends maintaining a figure of 7 or above.

Static Equivalent Radial Load P_0

The static equivalent radial load of the Cross-Roller Ring is obtained from the following equation.

$$P_0 = X_0 \cdot \left(F_r + \frac{2M}{dp} \right) + Y_0 \cdot F_a$$

- P_0 : Static equivalent radial load (N)
 F_r : Radial load (N)
 F_a : Axial load (N)
 M : Moment (N·mm)
 X_0 : Static radial factor ($X_0=1$)
 Y_0 : Static axial factor ($Y_0=0.44$)
 dp : Roller pitch circle diameter (mm)

Fig.3

Static Permissible Moment

The static permissible moment (M_0) of the Cross-Roller Ring is obtained from the following equation.

$$M_0 = C_0 \cdot \frac{dp}{2} \times 10^{-3}$$

- M_0 : Static Permissible Moment (kN·m)
 C_0 : Basic static load rating (kN)
 dp : Roller pitch circle diameter (mm)

Static Permissible Axial Load

The static permissible axial load (F_{a0}) of the Cross-Roller Ring is obtained from the following equation.

$$F_{a0} = \frac{C_0}{Y_0}$$

- F_{a0} : Static permissible axial load (kN)
 Y_0 : Static axial factor ($Y_0=0.44$)

Accuracy Standards

The Cross-Roller Ring is manufactured with the accuracy and the dimensional tolerance according to Table4 to Table15.

Table4 Rotational Accuracy of the Inner Ring of Model RU

Unit: μm

Model No.	Radial runout tolerance of the inner ring			Axial runout tolerance of the inner ring

1000	1250	0	−125	—	—	—	—	—	—
1250	1600	0	−160	—	—	—	—	—	—

Note1) Standard outer diameter accuracy of models RAU, RA, RA-C, and RU is 0. For higher accuracy than 0, contact THK.

Note2) "Dm" represents the arithmetic average of the maximum and minimum diameters obtained in measuring the bearing outer diameter at two points.

Note3) For accuracy grades in bearing outer diameter with no values indicated in the table, the highest value among low accuracy grades applies.

**Table14 Tolerance in the Width of the Inner and Outer Rings
for Models RU**

Unit: μm

Model No.	Tolerance of B	
	Upper	Lower

1000	1250	0	-300	0	-400

[Tolerance in the Width of the Inner and Outer Rings for Models RAU, RA, and RA-C]

All B and B1 types of models RAU, RA, and RA-C are manufactured with a tolerance of -0.120 to 0 .

Accuracy Standard of the USP-Grade Series

Examples of Rotational Accuracy of the USP-Grade Series Cross-Roller Rings

The rotation accuracy of the USP-Grade Series achieves the ultra precision grade that surpasses the world's highest accuracy standards such as JIS Class 2, ISO Class 2, DIN P2 and AFBMA ABEC9.

Rotational Accuracy of the Inner Ring of Model RB50040CC0USP

Rotational Accuracy of the Outer Ring of Model RE50040CC0USP

Accuracy Standards

The USP-grade series of models RU, RB and RE are manufactured with runout accuracies according to Table16, Table17.

Table16 Runout Accuracies of the USP-grade Series of Models RU

Model No.	Runout accuracy of the inner ring of model RU		Runout accuracy of the outer ring of model RU	
	Radial runout tolerance	Axial runout tolerance	Radial runout tolerance	Axial runout tolerance
RU 42	2	2	3	3
RU 66	2	2	3	3

Note) The Model RAU (small-diameter, 5 mm thin type) is only available with C0 clearance.

Moment Rigidity

Fig.4 to Fig.7 show moment rigidity diagrams for the Cross-Roller Ring as a separate unit. Rigidity is affected by the deformation of the housing, presser flange and bolts. Therefore, the strength of these parts must be taken into account.

(Radial clearance: 0)

(Note) The model number of a type with seals attached is RA...CUU.
If a certain level of accuracy is required, this model is used for inner ring rotation.

Model number coding

RA6008C **UU** **C0**

Model number

Radial clearance symbol (*1)

Seal attached on both ends (seal attached on either end: U)

(*1) See **A18-18**.

Fit

[Fitting of Models RU]

Fitting for model RU is typically not required. However, for fitting requiring positioning accuracy, h7 and H7 are recommended.

[Fitting of Models RB and RE]

For the fitting of models RB and RE, we recommend using the combinations indicated in Table1.

Table1 Fitting of Models RB and RE

Radial clearance	Service condition		Shaft	Housing
CC0	Inner ring rotational load	Normal load	g5	H7
		Large impact and moment		
	Outer ring rotational load	Normal load		
		Large impact and moment		
C0	Inner ring rotational load	Normal load	h5	H7
		Large impact and moment		
	Outer ring rotational load	Normal load	g5	Js7
		Large impact and moment		
C1	Inner ring rotational load	Normal load	j5	H7
		Large impact and moment	k5	Js7
	Outer ring rotational load	Normal load	g6	Js7
		Large impact and moment	h5	K7

Note) For the fitting for clearance CC0, avoid interference because it will cause an excessive preload. In addition, if higher rigidity is required, we recommend measuring the inner and outer diameters of the bearing and applying a slight interference fit to match the diameters.

[Fitting of the USP-grade]

For the fittings of the USP-grade series of models RB and RE, we recommend using Table2.

Table2 Fitting of the USP-grade

Radial clearance	Condition	Shaft	Housing
CC0	Inner ring rotational load	h5	J7
	Outer ring rotational load	g5	Js7
C0	Inner ring rotational load	j5	J7
	Outer ring rotational load	g5	K7

Note) It is recommended that you measure the inside and outside diameters of the bearing and provide a slight interference fit for those measurements.

[Fitting of Models RAU, RA and RA-C]

For the fitting of models RAU, RA, and RA-C, we recommend using g5 and g6 for the shaft and H7 for the housing.

Note) When using a Model RAU (small-diameter, 5 mm thin type), please design devices so that there is no interference.

Designing the Housing and the Presser Flange

Since the Cross-Roller Ring is a compact, thin device, special consideration must be given to the rigidity of the housing and the presser flange.

With types having a separable outer ring, insufficiency in the strength of the housing, pressure flange or the presser bolt will result in the inability to evenly hold the inner or outer ring, or the deformation of the Cross-Roller Ring when a moment load is applied. Consequently, the contact area of the rollers will become uneven, causing performance to significantly deteriorate.

Fig.2 shows examples of installing the Cross-Roller Ring.

[Housing]

When designing the thickness of the housing, make sure it is at least 60% of the sectional height of the cross roller ring as a general guide:

$$\text{Housing thickness } T = \frac{D-d}{2} \times 0.6 \text{ or greater}$$

(D: outer diameter of the outer ring; d: inner diameter of the inner ring)

If greater stiffness is desired, both the thickness of the housing and the fitting tolerance must be considered. Please contact THK when making such considerations.

● Shoulder Design

When designing the shoulder, ensure that the shaft shoulder diameter (ϕds) and the housing shoulder diameter (ϕDh) are outside the raceway area.

If the shoulder dimensions are within the raceway area, then an uneven load may apply, resulting in a faulty rotation.

For the shoulder dimensions, see the corresponding specification table.

● Tapped Hole for Ring Removal

By including tapped holes for inner and outer ring removal (Fig.1), it becomes possible to remove the rings without damaging the cross roller ring. Avoid pushing the inner ring when removing the outer ring, or vice versa.

Fig.1

● **Level difference between the inner and outer rings**

Since there is a level difference between the inner and outer rings of the Cross-Roller Ring, it is necessary to provide a clearance in the housing. The clearance must be at least twice the tolerance A of the width dimension. For the tolerance A of the width dimension, see the accuracy standard (see pages **A18-12** to **A18-16**).

Model No.	Width dimension
RB	B_{-A}^0
RE	
RA,RAU	$B_{-A}^0 = B_{1-A}^0$
RA-C	
RU	B_{-A}^0

Note) For models RB and RE, refer to the tolerance of the width dimension of B1.

Example of Assembly

Fig.2 and Fig.3 show examples of installing the Cross-Roller Ring.

Example of Assembling Model RE

a. Outer ring rotating in the swiveling unit
A heavy body part is mounted after the inner and outer rings are secured.

Example 1 of assembling model RB

b. Inner ring rotating in the swiveling unit
(with seals attached)

Example 2 of assembling model RB

c. Inner and outer rings secured in the same direction in the swiveling unit
(with seals attached)

Fig.2 Examples of Assembling Models RE and RB

Example 1 of assembling model RU

d. Inner and outer rings secured in the same direction in the swiveling unit (with seals attached)

Example 2 of assembling model RU

e. Inner and outer rings secured in the same direction in the swiveling unit (with seals attached)

Fig.3 Examples of Assembling Model RU

[Presser Flange and Presser Bolt]

When determining the thickness of the presser flange (F) or the clearance of the flange section (S), refer to the dimensions indicated below as a guide.

As for the number of the presser bolts, the greater the number of the bolts, the more stable the system becomes. As a guide, however, it is normally appropriate to use the number of bolts indicated in Table3 and equidistantly arrange them.

$$F = B \times 0.5 \text{ to } B \times 1.2$$

$$H = B_{-0.1}^0$$

$$S = 0.5 \text{ mm}$$

Even if the shaft and the housing are made of light alloy, it is recommendable to select a steel-based material for the presser flange. When assembling model RU, use the mounting holes or tapped holes built on the inner and outer rings (model RU does not require a presser flange).

When tightening the presser bolts, firmly secure them using a torque wrench or the like so that they will not loosen. Table4 shows tightening torques for the housing and presser flanges made of typical steel materials with medium hardness.

Table3 Number of Presser Bolts and Bolt Sizes for Models RB and RE

Unit: mm

Outer diameter of the outer ring (D)		No. of bolts	Bolt size (reference value)
Above	Or less		
—	100	8 or more	M3 to M5
100	200	12 or more	M4 to M8
200	500	16 or more	M5 to M12
500	—	24 or more	M12 or thicker

Note) Please contact THK regarding the number of presser bolts and bolt sizes for models RAU, RA, and RA-C.

Table4 Bolt Tightening Torque

Unit: N·m

Screw model No.	Tightening torque	Screw model No.	Tightening torque
M2	0.6	M8	30
M2.3	0.8	M10	70
M2.6	1.2	M12	120
M3	2	M16	200
M4	4	M20	390
M5	9	M22	530
M6	14		

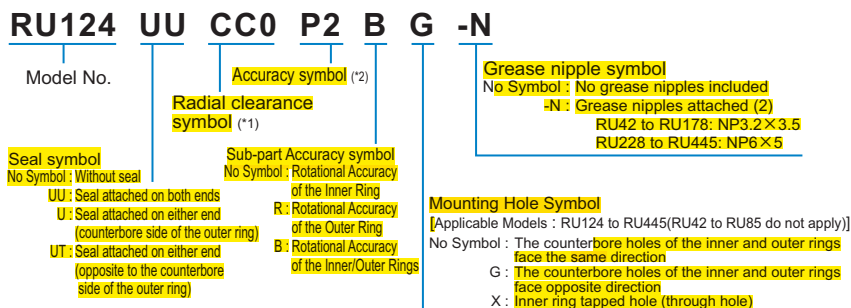

[Surface Treatment]

- (1) If the Cross-Roller Ring requires surface treatment, contact THK.
- (2) For the details of the surface treatment, see **B0-20** on the general catalog.
- (3) Note that in the case of standard model RU and special models, it is difficult to provide surface treatment to mounting holes built on the inner and outer rings, greasing holes, etc., and a treated film may not be formed on these areas.
- (4) Product accuracy (dimensional accuracy, rotational accuracy) is only guaranteed prior to surface treatment.

Model number configurations differ depending on the model features. Refer to the corresponding sample model number configuration.

Cross roller rings with integrated inner and outer rings.

- **Model RU**

(*1) See **A18-18**. (*2) See **A18-12** to **A18-17**.

- **Model RAU**

Precautions for the Model RAU (Small-Diameter, 5 mm Thin Type)

*Seals are not supported. *Only available with radial clearance C0. *Only available with normal grade accuracy (0).

*Precautions for Selecting Seals on One Side

Because the unmarked surface is used as the machining reference surface, we recommend assembling the cross-roller ring so that the unmarked surface faces the mounting reference surface. Choose a seal orientation to match your specifications.

Example: For inner ring rotation
when the seal is attached to the upper surface

(*1) See **A18-18**. (*2) See **A18-12** to **A18-17**.

[Cross Roller Ring]

● Models RB, RE, RA and RA-C

RB20030	C	UU	CC0	P2
Model No.				
Symbol				Accuracy symbol (*2)
No Symbol : Models RB, RE, and RA				(Models RB and RE only. For information on models RA or RA-C, contact THK.)
C : Model RA-C				No Symbol : Normal Grade (Grade 0)
				P6 : 6-grade rotational accuracy, PE6: 6-grade rotational accuracy + 6-grade dimensional accuracy
				P5 : 5-grade rotational accuracy, PE5: 5-grade rotational accuracy + 5-grade dimensional accuracy
				P4 : 4-grade rotational accuracy, PE4: 4-grade rotational accuracy + 4-grade dimensional accuracy
				P2 : 2-grade rotational accuracy, PE2: 2-grade rotational accuracy + 4-grade dimensional accuracy
				USP : USP-grade rotational accuracy
Seal symbol				
No Symbol : Without seal				Radial clearance symbol (*1)
UU : Seal attached on both ends				CC0 : Minus clearance (preload)
U : Seal attached on either end				C0 : Plus clearance
				C1 : Plus clearance (larger than C0)

When selecting U: Seal attached on either end, please specify whether the seal will be attached on the marked side or unmarked side. (The marked side is stamped with the model number.)

[Handling]

- (1) Please use at least two people to move any product weighing 20 kg or more, or use a dolly or another conveyance. Doing so may cause injury or damage.
- (2) The inner and outer rings, which are comprised of two parts, are held together with a special rivet or screws, so install as is. Incorrect installation of the spacer retainer will greatly affect rotational performance, do not disassemble the Cross Roller Ring.
- (3) Take care not to drop or strike the Cross Roller Ring. Doing so may cause injury or damage. Giving an impact to it could also cause damage to its function even if the product looks intact.
- (4) When handling the product, wear protective gloves, safety shoes, etc., as necessary to ensure safety.

[Precautions on Use]

- (1) Prevent foreign material, such as cutting chips or coolant, from entering the product. Failure to do so may cause damage.
- (2) If the product is used in an environment where cutting chips, coolant, corrosive solvents, water, etc., may enter the product, use bellows, covers, etc., to prevent them from entering the product.
- (3) Do not use the product at temperature of 80°C or higher. Exposure to higher temperatures may cause the resin/rubber parts to deform/be damaged.
- (4) If foreign material such as cutting chips adheres to the product, replenish the lubricant after cleaning the product.
- (5) Slight rocking can inhibit the formation of a film of oil between the rolling surface and the area of contact, resulting in fretting. THK recommends periodically rotating the cross roller ring several times to help ensure that a film forms on the surfaces and rolling elements.
- (6) Do not use undue force when fitting parts (pin, key, etc.) to the product. This may generate permanent deformation on the raceway, leading to loss of functionality.
- (7) The matching mark of the inner or outer ring may be slightly misaligned when delivered. In that case, loosen the bolts that secure the inner or outer ring, and correct the alignment using a plastic hammer or the like, before installing it to the housing. (Let the securing rivets follow the housing.)
- (8) When installing the Cross-Roller Ring, insert the ring by hammering the ring that is to be fixed (i.e. hammer the inner ring if the inner ring is to be fixed, or hammer the outer ring if the outer ring is to be fixed). Hammering the ring on the wrong side may cause damage.
- (9) Insufficient rigidity or accuracy of mounting members causes the bearing load to concentrate on one point, and the bearing performance will drop significantly. Accordingly, give sufficient consideration to the rigidity/accuracy of the housing and base and strength of the fixing bolts.
- (10) When installing or removing the Cross Roller Ring, do not apply force to the fixing rivets or the bolts.
- (11) When mounting the presser flange, take into account the dimensional tolerances of the parts so that the flange firmly holds the inner and outer rings from the side.

[Lubrication]

- (1) Do not mix different lubricants. Mixing greases using the same type of thickening agent may still cause adverse interaction between the two greases if they use different additives, etc.
- (2) When using the product in locations exposed to constant vibrations or in special environments such as clean rooms, vacuum and low/high temperature, use the grease appropriate for the specification/environment.
- (3) The consistency of grease changes according to the temperature. Take note that the torque of the Cross Roller Ring also changes as the consistency of grease changes.
- (4) Since the Cross-Roller Ring unit contains high-quality lithium soap group grease No. 2, it can be used without initially adding grease. However, this product requires regular lubrication since it has a smaller internal space than ordinary roller bearings and because of the rolling contact structure of the rollers.

To replenish grease, it is necessary to access greasing holes that lead to the oil grooves formed on the inner and outer rings. As for the lubrication interval, normally replenish the same type of grease so that it is distributed throughout the interior at least every three to six months. Set the final lubrication interval/amount based on the actual machine.

When the bearing is filled up with grease, the initial rotational torque temporarily increases due to grease resistance. However, surplus grease will run off of the seals and the torque will return to the normal level in a short period. The thin type does not have an oil groove. Secure an oil groove in the inner diameter side of the housing for lubrication.

- (5) Excess grease may protrude from the outside edge of the cross-roller ring. The structure of peripheral components will require careful consideration if contamination due to grease around the edges of the device is a concern.

[Storage]

When storing the Cross Roller Ring, enclose it in a package designated by THK and store it in a room in a horizontal orientation while avoiding high temperature, low temperature and high humidity. After the product has been in storage for an extended period of time, lubricant inside may have deteriorated, so add new lubricant before use.

[Disposal]

Dispose of the product properly as industrial waste.
