Smooth Silent Ecological

Caged Technology

For details, visit THK at www.thk.com

*Product information is updated regularly on the THK website.
Introduction

Since ball bearings in the initial stage of development were not provided with a cage, they produced high levels of noise, had a short service life and were unable to be used at high rotating speeds.

Later, caged ball bearings were developed that exhibited low noise levels even at high rotating speeds. In addition, these caged ball bearings were able to demonstrate long service life despite the number of balls being fewer than full ball types, and evolved significantly so that they were able to be used in a wide range of applications.

THK, the first manufacturer in the world to develop the LM Guide, has developed its LM Guide with Caged Ball Technology that is able to achieve a dramatic improvement in performance over conventional products. The LM Guide with Caged Ball Technology delivers a long service life and excellent high-speed performance in the same manner as roller bearings, while also eliminating maintenance for a long period of time.

Rotary Bearings

Initial Stage of Development (Full Ball Type)
- Metal contact between balls caused a shortage of grease life.
- Short service life

Current Bearings (Caged Ball Type)
- Grease is held by the cage for excellent lubrication.
- No metal contact between balls for extended service life.
- No metal contact between balls suppresses generation of heat.
- No metal contact between balls eliminates ball collision noise.
- Balls exhibit orderly movement for smooth operation.

Case of the LM Guide

Without caged ball

Friction occurs between balls resulting in the generation of collision noise

With caged ball

Absence of friction between balls eliminates the generation of collision noise for quiet operation
Structure of the LM Guide with Ball Cage
**Quiet Operation that Minimizes Metal Contact**

Collision noise between balls is eliminated by the ball cage resulting in quiet operation.

Since metal contact occurs only at the load zone, metal noise is held to a minimum.

**Orderly Ball Movement**

Since the balls are held by the ball cage in the form of a belt, they are aligned uniformly and move in a circulating manner. There is no skewing of the balls, while sudden variations in friction are also eliminated, allowing for stable movement.

**Advantage of Caged Ball 1**

- **Generation of collision noise between balls**
- **Absence of collision noise between balls**

**Advantage of Caged Ball 2**

- **In the case of the full ball type, the balls demonstrate skewing and move randomly.**
- **Balls are guided by the ball cage so as to be uniformly aligned in the direction of circulation for smooth operation.**

**Conventional type (without ball cage) circulating path**

**Ball cage type circulating path**
**Original Cage Structure Exhibiting Excellent High-Speed Performance**

The use of ball cages eliminates generation of heat caused by friction between balls resulting in excellent high-speed performance.

**Advantage of Caged Ball**

3. Original Cage Structure Exhibiting Excellent High-Speed Performance

Contact state between balls and ball cage

![Ball cage](image)

State at turning sections

**Grease Holding Structure (Consecutive Grease Pockets) for Long-Term, Maintenance-Free Operation, Long Service Life**

Grease pockets are provided consecutively over the entire ball circulation path to constantly lubricate the balls enabling long-term, maintenance-free operation, Long Service Life.

**Advantage of Caged Ball**

4. Grease Holding Structure (Consecutive Grease Pockets) for Long-Term, Maintenance-Free Operation, Long Service Life

Grease pockets are provided throughout the ball cage.

Grease retention status after travel (SHS45LV: load endurance test)
Data on LM Guide with Caged Ball

Improved Service Life

The Caged Ball not only allows the LM guide to be run for a long time period free of maintenance, but also significantly improves the service life of the system. As described below, a performed service life test has offered data about this improvement.

Service life test for LM Guide

1. Testing instrumentation

2. Testing parameters

Model: SHS25V1SS+580LP / HSR25A1UU+580LP
Number of pieces: 32
Load: 11.1 kN per LM block (0.35 C of SHS25V)
Lubricant: Lithium soap base grease No. 2, Only initial lubrication
3. Test results

The results of the performed test indicate that the dynamic durability values of the LM guide implemented by Caged Technology are higher than of the conventional LM guide.

Status of Remaining Grease after the Durability Test

Ball cage before running

Ball cage after running 8,000 km (Test stop)

Remaining grease is observed in the ball cage.

The results of the performed test indicate that the dynamic durability values of the LM guide implemented by Caged Technology are higher than of the conventional LM guide.
**Rolling Resistance Data**

The use of a ball cage enables the balls to be uniformly aligned, eliminating crowding of the balls that occurs when they enter the block. As a result, smooth and stable movement can be obtained in all forms of installation, and fluctuations in rolling resistance are reduced for the realization of high accuracy.

![Graph of rolling resistance data](image1.png)

Results of Measuring Fluctuations in Rolling Resistance of HSR25LR (without ball cage) (feeding speed: 10 mm/sec)

Results of Measuring Fluctuations in Rolling Resistance of SHS25LV (with ball cage) (feeding speed: 10 mm/sec)

**Noise Level Data**

The use of a ball cage eliminates interference between balls resulting in low noise levels.

![Graph of noise level data](image2.png)

Comparison of Noise Levels Between the SHS35LV and HSR35LR

Comparison of Noise Levels Between the SHS35LV and HSR35LR (speed: 50 m/min)
Low Generation of Dust

The use of a ball cage eliminates friction between balls resulting in a corresponding decrease in the generation of metal wear fragments for outstanding effects against prevention of the generation of dust.

High-Speed Durability Test Results

Since the use of a ball cage eliminates friction between balls, there is less generation of heat making it possible to demonstrate excellent high-speed operation.

Sample: SHS65LVSS
Speed: 200 m/min
Stroke: 2500 mm
Lubrication: Initial injection of grease only
Load: 34.5 kN
Acceleration: 1.5 G

Grease was still present and there were no abnormalities observed in the balls or grease.

### Features of the **SRG/SRN/SRW** type

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Prevents roller skewing</td>
<td>The use of a roller cage allows the rollers to circulate while uniformly aligned, preventing skewing when entering block load area, and reducing variation in rolling resistance to obtain stable and smooth movement.</td>
</tr>
<tr>
<td>Long-Term, Maintenance-Free Operation</td>
<td>The use of a roller cage eliminates friction between rollers, and retains lubricant in the grease pockets between adjacent rollers, ensuring the required amount of lubricating oil is supplied to the curved contact surfaces of the spacers and rollers of the circulating path to realize long-term maintenance-free operation.</td>
</tr>
<tr>
<td>Ultra-High Rigidity</td>
<td>Ultra-high rigidity is achieved by using rollers having a low degree of elastic deformation for the rolling elements and an optimized roller diameter and length. Also, each row of rollers is arranged at a 45° contact angle so that an equal load rating is applied in four directions (radial, reverse radial, and lateral directions).</td>
</tr>
<tr>
<td>Global Standard Dimensions</td>
<td>The dimensional design complies with the Type HSR developed by THK as the pioneer of linear motion systems and has become the global standard.</td>
</tr>
</tbody>
</table>
**LM Guide with Caged Roller Technology**

---

**Rolling Resistance Value Data**

The use of a roller cage eliminates friction between rollers while also enabling the rollers to circulate while uniformly aligned. As a result, there is reduced occurrence of skewing allowing stable movement.

---

**Durability Data**

The use of a roller cage enables grease to be retained in the space between adjacent rollers, realizing long-term, maintenance-free operation by inhibiting the escape of grease from the circulating path.

---

**Sample** : SRG45LCC0

**Conditions** :
- Pre-loading : C0 clearance
- Speed : 180 m/min
- Acceleration : 1.5 G
- Stroke : 2300 mm
- Lubricant : Initial injection of grease only

- Intermediate results:
  - No abnormalities during 15,000 km of travel
  - No flaking or insufficient grease was not observed

---

**Adequate grease remains**

**Roller Cage**

**Rollers**

**No discoloration of grease is observed.**

---

**Detailed drawing of roller cage**

Ball Screw with Ball Cage

SBN/SBK/SBKNSDA/HBN/SBK

Structure of the **SBK** type

- Ball cage
- Two-raceway, large-lead screw shaft
- Ball screw nut
- End cap
- Balls
Features of the **SBK** type

**High-speed Operation**

Because of its circulation structure where the end caps enable the balls to be picked up in the tangential direction and the lead angle direction, this model is capable of high-speed operation at a DN value of 160,000, achieving high-speed feed 2.2 times faster than the conventional model.

**Low Noise, Acceptable Running Sound**

Use of a ball cage allows balls to be evenly spaced and eliminates collision noise between balls. In addition, balls are picked up in the tangential direction, which also contributes to eliminating collision noise. As a result, *low noise and acceptable running sound are achieved.*

**Long-term Maintenance-free Operation**

The formation of grease pockets increases grease retention and achieves *long-term maintenance-free operation.* In addition, even in adverse environments (e.g., coolant, foreign matter), this model ensures long-term maintenance-free operation when attached with an optional wiper ring or a QZ Lubricator*. (*: For wiper ring and QZ Lubricator, contact THK.)*

**Excellent Sliding Properties**

Ball cages arranged between balls eliminate mutual friction of the balls and significantly improve torque characteristics. Pre-load dynamic torque fluctuations are also reduced allowing the obtaining of *excellent sliding properties.*
Improved Service Life

Service life test under a high speed (free of maintenance)

Testing instrumentation for a long-period high-speed test was used to test model SBK with lubrication system QZ. The operating cycles were run under a DN value of 160,000 and with only initial lubrication carried out.

### Conditions
