NEW Large Lead Series

Compact Caged Ball Screw

Capable of operating at high speed 5000 min\(^{-1}\) (max DN value: 130,000)
Achieves a slim nut with a new circulation system
Low noise, long-term maintenance-free operation, low torque fluctuation

Contributes to downsizing the equipment and lowering the center of gravity

For details, visit THK at www.thk.com

*Product information is updated regularly on the THK website.*
Compact Caged Ball Screw

Structure

Model SDA is a compact Ball Screw with ball cage that adopts an end-cap circulation system.

Features

Superb high-speed response

Use of a newly developed end cap and R piece achieves an ideal ball-circulation structure. This enables SDA to perform high-speed operation at 5000 min⁻¹ (maximum DN value: 130,000) (approx. twice the previous model).
● Slim nut with a new circulation system
Use of a newly developed end cap and R piece achieves an ideal ball-circulation structure and significant downsizing of the product.
The nut dimensions are compliant with a DIN standard (DIN69051).*
* DIN standards refer to “Deutsche Industrie Normen” (German industrial standards) established by “Deutsches Institut für Normung e.V.” (DIN, German Institute for Standards in English), and are broadly used as standards in all industrial fields in many countries in Europe, Asia, etc.

● Long-term maintenance-free operation
Use of a ball cage enables the formation of a grease pocket to increase grease retention, achieving long-term maintenance-free operation.

● Low noise, comfortable running sound
Use of a ball cage eliminates collision noise between balls and ensures comfortable running sound. In addition, an ideal circulation structure consisting of a newly developed end cap and R piece further reduces noise.

● Smooth motion
Since the use of a ball cage eliminates collision and mutual friction between balls, smooth and stable motion with low torque fluctuation is achieved.

---

* Reduced by 30% max in outer diameter

THK
Lead accuracy and axial clearance

**Lead accuracy**
Compliant with ISO (International Organization for Standardization) standards and DIN standards (Deutsche Industrie Normen), in addition to the formerly observed JIS (Japanese Industrial Standards).

Options
For model SDA, QZ Lubricators and Wiper Rings for Ball Screws are available as options. QZ Lubricators which contains a highly oil impregnated fiber net are designed for long term maintenance free operation. Contact type seal, Wiper Ring W, excels in foreign material removal.

**QZ Lubricator**
QZ Lubricator is a lubrication system that supplies the adequate amount of lubricant to the raceway of the ball screw shaft.

**Features**
- Significantly extends maintenance interval
- An eco-friendly lubrication system

With ordinary grease lubrication in Ball Screws, a slightly amount of oil is lost as the Ball Screw operates. Attaching QZ Lubricator will supplement the oil loss over a long period of time and significantly extend the maintenance interval.

Since QZ Lubricator supplies the adequate amount of oil to the appropriate place through a high-density fiber net, it is an eco-friendly lubrication system that does not waste oil.

**Wiper ring W**
In wiper ring W, a highly wear resistant special resin elastically contacts the circumference and thread groove of the ball screw shaft, and removes foreign material from eight slits, preventing it from entering the ball screw nut.

**Features**
- Prevents foreign material from entering the ball screw nut.
- Contacts the ball screw shaft at constant pressure to reduce heat generation.
- Excels in resistance to wear, impact and chemicals.
- Attaching QZ Lubricator for Ball Screws and wiper ring W would significantly extend the maintenance interval even in a harsh environment.
Static safety factor

Basic static load rating $C_{oa}$
Basic static load rating ($C_{oa}$) generally means the permissible axial load of a Ball Screw. Depending on the service conditions, it is necessary to consider the following static safety factor for the calculated load. Note that when a Ball Screw is stationary or in motion, an unexpected external force may be applied due to an inertial force generated through collision or start/stop action.

**Static safety factor $f_s$**

$$f_s \leq \frac{C_{oa}}{F_a}$$

$f_s$ : Static safety factor  (Table 1)
$C_{oa}$ : Basic static load rating* [kN]
$F_a$ : Axial load [kN]

* Basic static load rating ($C_{oa}$) refers to the static load with a uniform direction and magnitude at which the sum of the permanent deformation of the rolling element and the permanent deformation of the raceway is 0.0001 times the diameter of the rolling element at a contact point to which the maximum stress is applied. The basic static load rating of a Ball Screw is defined on the basis of the axial load (specific value of each Ball Screw model is indicated in the dimensional table of the respective model).

Rated life and service life time

Basic dynamic load rating $C_s$
Basic dynamic load rating ($C_s$) is used to calculate the service life of a Ball Screw operating under a load. Basic dynamic load rating ($C_s$) refers to the load with constant direction and magnitude at which the rated life $L$ is $10^6$ [rev] when a group of identical Ball Screw units independently operate (basic dynamic load rating ($C_s$) is indicated in the dimensional table of the respective model).

**Rated life $L$ (total number of revolutions)**
The service life of a Ball Screw is obtained from the following equation based on the basic dynamic load rating and the applied axial load.

$$L = \left( \frac{C_s}{f_s \cdot F_a} \right)^3 \times 10^6$$

$L$ : Rated life (total number of revolutions) [rev]
$C_s$ : Basic dynamic load rating*2 [kN]
$F_a$ : Applied axial load [kN]
$f_s$ : Load factor (Table 2)

*2 The rated life is calculated through load calculation assuming that favorable lubrication is secured and the product is assembled under ideal mounting conditions. The accuracy and deformation of the mounting member may affect the service life.

**Service life time $L_h$**
When the rated life ($L$) has been obtained, the service life time ($L_h$) is obtained from the following equation if the stroke length and the number of reciprocation are constant.

$$L_h = \frac{L \times Ph}{2 \times \varepsilon_s \times n_1 \times 60}$$

$L_h$ : Service life time [h]
$\varepsilon_s$ : Stroke length [mm]
$n_1$ : Number of reciprocations per minute [mm⁻¹]
$Ph$ : Lead [mm]

**Example of model number coding**

SDA2520-2.8 QZ RR G0 +830L C3

1. Model number
2. With QZ Lubricator (no symbol for without QZ Lubricator)
3. Seal symbol (RR: labyrinth seal on both ends; WW: wiper ring on both ends)
4. Axial clearance (see P.3)
5. Overall length of ball screw shaft (in mm)
6. Accuracy standard (see P.3)

**Precautions**

If desiring to shape both ends of the screw shaft to have a larger diameter than the outer diameter of the screw shaft, contact THK.

Note 1: The maximum permissible rotation speed is calculated from the DN value. Calculate the critical speed, and then select the lower value.

Note 2: Each rigidity value (K) in the table indicates the spring constant obtained from the load and the elastic deformation when an axial load at 30% of the basic dynamic load rating (Ca) is applied.

This value does not include the rigidity of parts related to the ball screw nut mounting section. Normally, apply 80% of the rigidity value (K) in the table.

If the axial load (Fₐ) is not 0.3 Ca, the rigidity value (K₀) is obtained from the following equation.

\[
K₀ = K \left( \frac{Fₐ}{0.3Ca} \right)^{-1/3}
\]

K: Rigidity value in the dimensional table

<Unit: mm

* : The outer diameter dimension is compliant with DIN standard 69051 (lead 5 or less).

Compact Caged Ball Screw Model SDA

Precautions on use

- **Handling**
  - Do not disassemble the parts. Doing so may allow dust to enter the product and/or cause functional loss.
  - Tilting the ball screw shaft and the ball screw nut may cause them to fall by its own weights.
  - Do not drop or hit the Ball Screw. Doing so may cause personal injury and/or damage the product. Applying an impact to the product may cause functional loss even if the product looks intact.
  - Do not remove the ball screw nut from the ball screw shaft. Doing so may cause balls or a ball cage to fall and make the product inoperable.
  - Take care not to allow foreign material such as dust and cutting chips to enter the product. Failure to do so may damage the ball circulation part or cause functional loss.
  - Some types of coolants may affect the functionality of the product. If using the product in an environment where a coolant could enter the ball screw nut, contact THK.
  - Do not use the product at temperature exceeding 80°C. If the product is attached with QZ Lubricator, be sure to use it at temperature 50°C or below.
  - If foreign material such as dust and cutting chips adheres to the product, replenish the lubricant after cleaning the product. For the purpose of the cleaning fluid, contact THK.
  - If using the product for vertical application, take a measure to prevent it from falling such as adding a safety mechanism. Failure to do so may cause the ball screw nut to fall by its own weight.
  - Do not use the product at speed exceeding the permissible rotation speed. Doing so may damage the product or cause an accident. Make sure that the service rotation speed is within the specification range designated by THK.
  - Do not forcefully drive any component into the ball screw shaft or the ball screw nut. Doing so may cause an indentation on the raceway. Take care when mounting components.
  - If misalignment or skewing occurs in the ball screw shaft support and the ball screw nut, it may substantially shorten the service life. Pay much attention to the components to be mounted and to the mounting accuracy.
  - If using the product in a location constantly exposed to vibrations or in a special environment such as a clean room, vacuum, low temperature and high temperature, contact THK.
  - Do not let the ball screw nut overshoot. Doing so may cause balls to fall or damage the ball circulation part.

- **Lubrication**
  - Thoroughly wipe off anti-corrosion oil and feed lubricant before using the product.
  - For use with high-speed rotation application, we have selected THK Grease AFJ for SDA Ball Screw. THK Grease AFJ provides superior performance in low-heat-generating characteristics.
  - Do not mix lubricants with different physical properties.
  - In locations constantly exposed to vibrations or in special environments such as a clean room, vacuum, low temperature and high temperature, normal lubricants may not be used. Contact THK for details.
  - If planning to use a special lubricant, contact THK before using it.
  - Lubrication interval varies according to the service conditions. Contact THK for details.
  - In types attached with QZ Lubricator, the required minimum amount of lubricant is supplied to the raceway. Depending on the service conditions such as vertical application, the lubricant may drop from the ball screw shaft due to the nature of the lubricant.
  - Do not use the product at temperature exceeding 80°C. If the product is attached with QZ Lubricator, be sure to use it at temperature 50°C or below.
  - Some types of coolants may affect the functionality of the product. If using the product in an environment where a coolant could enter the circulation part or cause functional loss.

- **Storage**
  - When storing the Ball Screw, enclose it in a package designated by THK and store it in a horizontal orientation while avoiding low temperature, high temperature and high humidity.
